A7 flexible active array [20]	D	D		D	D	D			D	Q

·T a measured duration for the stage, with identifiable start and end events

·(T) a duration for the stage that is only a stated share, component or residual of an aggregate

·[R] a rate, not a duration

† no independently measured settling duration exists in the reviewed set; the A4 entry is a component of an aggregate on one platform and a deliberately allocated wait on the other

* geometry held static throughout the timed interval

■ Q quantitatively measured ■ A / S assumed or simulated

■ D demonstrated, no quantity □ absent / not applicable

across the reviewed set: morphing (S7) is measured only on platforms with no RF layer; settling (S8) has no measured duration on any platform; calibration (S9) is untimed; and S10 is measured only with geometry static
