

system-model assumption	link	closest evidence in the reviewed set
geometry freely selectable within a morphing range	G1	commanded shape control [7], [8] — no RF layer
morphing instantaneous, or within one coherence block	G2	≈ 300 ms surface morph [8] — bare elastomer
computed shape stays usable irrespective of delay / Doppler		no bound, condition or experiment in reviewed set
mapping re-established whenever needed	G3	closed-loop refocusing [20] — not timed
radiation trustworthy as soon as the shape is set	G4	16.7 ms to stabilised RF [6] — geometry static
command transport and electronic update are free		≈ 5.5 ms of 16.76 ms; $\times \frac{1}{4}$ multiplexing — measured

Dashed links are unsupported by a measurement on a comparable object: architecture mismatch (red), operation demonstrated but untimed or measured from the wrong start event (amber). G1–G4 name the missing interval (Table 4).
